                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide 3-kinase, regulatory subunit 4, p150. The phosphoinoside comprises at least one modified internucleoside linkage, oligonucleotides comprises at least to modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The nucleobase, preferably a S-methylcytosine. The antisense oligonucleotide nucleobase, indiagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder. preferably cancer, chediak Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The phosphoinositide-3-kinase, regulatory subunit 4, p150. The comprises at least one modified internucleoside linkage, coligonucleotides comprises at least one modified sugar modety, preferably a 2'-O-methoxyethyl sugar modety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methoxyethyl sugar modety. The nucleobase, preferably a 5-methoxyethyl sugar modety. The can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, condition associated with phosphoinositide-3-kinase, regulatory or condition associated with phosphoinositide-3-kinase, regulatory condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                              antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethlyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0.4%; Score 20; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel antisense oligonuclectides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonuclectides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2-0-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide on this and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositided-1-kinase, regulatory subunit 4, p150. The phosphoinositided-1-kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperprofiferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human oppositions titled-3-kinase, regulatory subunit 4, p150. The phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one antisense oligonucleotide further comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                           compound targeted to a nucleic acid molecule encoding
                                                                                                                                                                                                                                              phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder
                                                                                                                                                                                                                                                                                                  Example 15; SEQ ID NO 137; 60pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide3-% timase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified uncleobase, preferably a S-Methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphorositides. Finase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, oligonucleotides comprises at least to modified internucleoside linkage, or antisense oligonucleotide further comprises at least one modified and moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a S-methylyvtosine. The antisense oligonucleotide combrises at least one modified nucleobase, preferably a S-methylyvtosine. The antisense oligonucleotide combrises and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphonositided-3 kinase, regulatory subunit 4, p150. The phosphoinositided-3 kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moisty, preferably a 2'-O-methoxyethyl sugar moisty. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methyloytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperprofiferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; pl50; internucleoside linkage; phosphorothioate linkage; 2'-0-methoxyethyl sugar; 5-methylcytosine; phosphorothioate linkage; 2'-0-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124593.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound targeted to a nucleic acid molecule encodin
phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for
treating cancer, Chediak-Higashi syndrome or a metabolic disorder.

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, pi50. The phosphoinositide-3-kinase at least one modified internucleoside linkage, or modified sugar molety, preferably a 2'-0-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified antisense oligonucleotide further comprises at least one modified antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, and inflammation or tumour formation. It can also be used to treat a disease condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably canner, character immunomodulators with cytostatic activity and can be used
New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20 BP; 2 A; 5 C; 8 G; 5 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                       Example 15; SEQ ID NO 89; 60pp; English.

```
This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2-0-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation associated with phosphoinositide-3-kinase, regulatory concondition associated with phosphoinositide-3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antimense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124666.
    New antisense compound targeted to a nucleic acid molecule encoding
                    phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.

Example 15; SEQ ID NO 143; 60pp; English

```
specifically hybridises to and inhibits the expression of human phosphoinositide-14 kinase, regulatory subunit 4, p150. The phosphoinositide-3-kinase, regulatory subunit 4, p150. The cligonuclectides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonuclectide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonuclectide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonuclectide further comprises at least one modified can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory combunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-0-methoxystehyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The phosphoinositides comprises at least one modified internucleoside linkage, oligonucleotides comprises at least one modified super modety, preferably a 2'-O-methoxyethyl sugar moiety. The modified sugar modety, preferably a 2'-O-methoxyethyl sugar moiety. The curisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide curisense oligonucleotide inclammation of moderophylactically, e.g. to prevent or delay infection, condition associated with phosphoinositide-3-kinase, regulatory curies subunit 4, p150, e.g. typerproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                          Sequence 20 BP; 7 A; 3 C; 8 G; 2 T; 0 U; 0 Other;

                          This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, piso. The coligonucleotides comprises at least one modified internucleoside linkage, oligonucleotides comprises at least one modified internucleoside linkage, comprises at least one modified sugar molety, preferably a 5-To-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory condition associated with phosphoinositide-3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                   ઠે
                                         This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide—3-kinase, regulatory subunit 4, pi50. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2-0-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also inflammation or tumour formation. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide—3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          regulatory subunit 4; pi50; internucleoside linkage;
phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine;
infection; inflammation; tumour formation; hyperproliferative disorder;
cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositided-1 kinase, regulatory subunit 4, p150. The phosphoinositided-3 kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar modety, preferably a 2'-O-methoxyethyl sugar modety. The antisense oligonucleotide further comprises at least one modified sugar modety, preferably a 5-methylcytosine. The antisense oligonucleotide colleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperprofiferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioare linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The cligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified an be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumnour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder. The products of the continual and the products of the products of the continual and a metabolic disorder. The products of the continual and a metabolic disorder. The products of the continual and the products of the continual and the continual and the products of the continual and the continua

ö
modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioare linkage; 2'-O-methoxystehyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 20;

ö
preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified be used prophylaterically a 5-methylcytosine. The antisense oligonucleotide can be used prophylaterically or prevent or datay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory condition, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioact linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The

preferably a phosphorothioate linkage. It also comprises at least one modified dead an underly a preferably a 2'-O-methoxytehyl sugar molety. The antisense oligonuclectide further comprises at least one modified antisense oligonuclectide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonuclectide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonuclectide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phospholnositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorochioare linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; thomour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                               Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human

The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified
phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, oligonucleotides comprises at least one modified internucleoside linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease crossociated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-0-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ds.

This invention describes a novel antisense oligonuclectides which specifically hybridises to and inhibits the expression of human phosphoinostitide-3-kinase, regulatory subunit 4, pl50. The policy probability of the properties of least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar motery, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kire. It can also be used prophylactically, e.g. to prevent or delay infection, is discussed in flammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory
                                                                                                                                                                                                                                                                                                 ö
nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subbunit 4, p150, e.g. hyperproliferative disorder. preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothicate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi. syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124613.

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, piso. The phosphoinositide-3-kinase at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory conduction associated with phosphoinositide-3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                   ô
subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ds.
                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124634.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.

This invention describes a novel antisense oligonuclectides which specifically hybridises to and inhibits the expression of human phosphoinositide-3 kinase, regulatory subunit 4, p150. The phosphoinositide-3 kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified and modety, preferably a 2'-O-methoxyethyl sugar modety. The antisense oligonucleotide further comprises at least one modified contisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease contition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used

The coligonucleotides comprises at least to me dolified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The artisense oligonucleotide further comprises at least one modified sugar moiety, preferably a 2'-Methoxyethyl sugar moiety. The modified sugar moiety, preferably a 2'-methoxyethyl sugar moiety. The nucleobase, preferably a 5-methoxyetosine. The antisense oligonucleotide nucleobase, preferably a 5-methoxyetosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory condition associated with phosphoinositide-3-kinase, regulatory condition are immunomodulators with cytostatic activity and can be used invention are immunomodulators with cytostatic activity and can be used
                                                                 ö
                                                                                                                                                                                                                                                                                 antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothicate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human specifically hybridises to and inhibits the expression of human constructed that the second internation of human colifications tides shown that a least one modified internations at least one preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The modified sugar moiety preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified an beach of indiagnostics and as research reagents and kits. It can also can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, pls0, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human bybosphoinostides. regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinostitide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer,
                                                                                                                                                                                                                                                                                        antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; plS0; internucleoside linkage; phosphorothioate linkage; 2'-0-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
 invention are immunomodulators with cytostatic activity and can be used
                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.

At mase, regulatory subunit 4, pls0. The phosphoriositides are least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory

The phosphoronisitides—1-kinase, regulatory subunit 4, p150. The preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcycosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or dalay infection, inflammation or tumour formation. It can also be used to treat a disease
                                                                                                                  ..

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, pi50. The soligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcyclosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection,
                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chedlak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide 3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinostide-3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one molifieds engare moiety a 5-methylycosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylycosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also
inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinostitide-1-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the
                                               invention are immunomodulators with cytostatic activity and can be used

The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'0-methoxyethyl sugar moiety antisense oligonucleotide further comprises at least one modified
                                               a disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antimense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; pi50; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chedlak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
                                                                                                                                                                                            invention are immunomodulators with cytostatic activity and can be used for gene therapy.
be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disea or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the

can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel antisense oligonuclectides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonuclectides comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense; inhibitor; hybridisation; human; phosphoinositide-1-kinase; regulatory subunit 4; pl50; internucleoside linkage; phosphorothioate linkage; 2'-0-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;

nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory combunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human oliospitales. regalatory subunit 4, pi50. The hospital phosphoinositides. regalatory subunit 4, pi50. The preferably a phosphorothioate last one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-0-methoxystehyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124599.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound targeted to a nucleic acid molecule encoding

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioste linkage. It also comprises at least one modified modified sugar molety, preferably a 2-0-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably e.g. to delay infection, inflammation or tumour formation. It can also be used prophylactically, e.g. to delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                    ö
subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothicate linkage; 2'-O-methoxysterhyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124633.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                    ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phophorionalitade. Atlanse, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide con nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory combunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide 3-kinase, regulatory subunit 4, p150. The phosphoinositide comprises at least one modified internucleoside linkage, oligonucleotides comprises to medified internucleoside linkage, preferably a 2-O-methoxyethyl sugar moiety. preferably a 2-O-methoxyethyl sugar moiety. The modified sugar moiety, preferably a 2-O-methoxyethyl sugar moiety. The modified sugar moiety, preferably a 2-O-methoxyethyl sugar moiety. The nucleobase, preferably a S-methylcytosine. The antisense oligonucleotide uncleobase, preferably a S-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory condition associated with phosphoinositide-3-kinase, regulatory condition associated with phosphoinositide-3-kinase, regulatory condition are immunomodulators with cytostatic activity and can be used invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                               regulatory subunit 4; p150; intermucleoside linkage; phosphoinositide-3-kinase; phosphorothicate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higamil syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.4%; Score 20; DB 1; Length 20; 100.0%; Pred. This invention describes a novel antisense oligomucleotides which specifically hybridises to and inhibits the expression of human specifically hybridises to and inhibits the expression of human of phosphoinositide-3-kinase, regulatory subunit 4, p150. The comprises at least one modified internucleoside linkage. Composition internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one contised super moiety, preferably a 2'-O-methoxyethy! sugar moiety. The modified sugar moiety, preferably a 2'-O-methoxyethy! sugar moiety. The contiseobase, preferably a sentity comprises at least one modified undleobase, preferably a senthylcytosine. The antisense oligonucleotide can be used prophylactically, e.g. to prevent or delay infection, complylactically, e.g. to prevent or delay infection, condition associated with phosphoinositide-3-kinase, regulatory or condition associated with phosphoinositide-3-kinase, regulatory condition, associated with phosphoinositide-3-kinase, regulatory condition, are immunomodulators with cytostatic activity and can be used invented the condition are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                      antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioste linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide 3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP; 8 A; 5 C; 3 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "phosphorothioate backbone"
                                                                                                                                                                                                                                                                           ISIS antisense oligonucleotide ISIS 206966.

```
This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The phosphoinositide-3-kinase at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one moitified sugar molety, preferably a 2-O-methoxycthyl sugar molety. The antisense oligonucleotide further comprises at least one molety. The antisense oligonucleotide further comprises at least one molety. The nucleobase, preferably a 5-methycytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also can be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used

```
This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphonostitide-3-kinase, regulatory subunit 4, p150. The phosphonostitide-3-kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified uncleobase, preferably a 5-methylcytosine. The antisense oligonucleotide conclude and an end as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperprofiferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Seguence 20 BP; 8 A; 4 C; 4 G; 4 T; 0 U; 0 Other;

This invention describes a novel antisense oligomucleotides which specifically hybridises to and inhibits the expression of human specifically hybridises to and inhibits the expression of human compositions at least one modified internucleoside linkage. Coligomucleotides comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligomucleotide further comprises at least one modified sugar moiety, preferably a 2'-methoxyethyl sugar moiety. The modified sugar moiety, preferably a 2'-methoxyethyl sugar moiety. The moleobase, preferably a S-methylycytosine. The antisense oligomucleotide uncleobase, preferably a s-methylycytosine. The antisense oligomucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, pls0, e.g. hyperproliferative disorder, preferably cancer, channel to are immunomodulators with cytostatic activity and can be used invention are immunomodulators with cytostatic activity and can be used

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human specifically hybridises to and inhibits the expression of human compositionsitide-3-kinase, regulatory subunit 4, p150. The phosphoinositide-3-kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The confise of preferably a 5'-O-methoxyethyl sugar moiety. The confise of preferably a senethylcycsine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, condition associated with phosphoinositide-3-kinase, regulatory condition associated with phosphoinositide-3-kinase, regulatory condition associated with phosphoinositide-3-kinase, regulatory condition, associated with phosphoinositide-3-kinase, regulatory condition are immunomodulators with cytostatic activity and can be used invented the condition are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel antisense oligonuclectides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonuclectides comprises a least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human thosphorositéde3-*Kinase, regulatory subunit 4, p150. The phosphoriositéde3-*Kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, condition and subunit 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nvention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124670.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.4%; Score 20; DB 1; Length 20; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel antisense oligonuclectides which specifically hybridises to and inhibits the expression of human phosphoinositide 3. Figuratory subunit 4, p150. The phosphoinositide 3. Figuratory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, oligonucleotides at least to modified sugar moiety, preferably a 2'-O'methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified sugar moiety, preferably a 2'-O'methoxyethyl sugar moiety. The nucleobase, preferably a S-methylytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinae, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioare linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
   antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioarte linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADL34572;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 285
```

```
This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The phosphoinositide-3-kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The confised sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The nucleobase, preferably a 5-methylycvesine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, condition associated with phosphoinositide-3-kinase, regulatory can condition associated with phosphoinositide-3-kinase, regulatory can subunit 4, p150, e.g. hyperproliferative disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-0-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel antisense oligonucleotides which specifically hybridiess to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, pi50. The oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide in inappostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder, preferably cancer, invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, pl50. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory conduction, and syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide 3-Kinase, regulatory subunit 4, p150. The phosphoinositide 3-Kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, or disponucleotides comprises. It also comprises at least one modified sugar moiety, preferably a 2'-Omethoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified and such a season of the antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
phosphorothioate linkage, 2'-O-methoxyethyl sugar; 5-methylcytosine, infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase;

This invention describes a novel antisense oligomucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, piso. The phosphoinositide-3-kinase, regulatory subunit 4, piso. The coligomucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one carisense oligomucleotide further comprises at least one modified sugar modety, preferably a 2'-O-methoxyethyl sugar modety. The nucleobase, preferably a 5-methoxyethyl sugar modety. The nucleobase, preferably a senestynes at least one modified nucleobase, preferably a senestynes at least one modified can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, piso, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124606.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The phosphoinositide-3-kinase at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one moiety modified sugar moiety, preferably a 2-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one moiety. The nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnosetics and as research reagents and kits. It can also inflammation or tumour formation. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; S-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antigense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxysthyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124630
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.4%; Score 20; DB 1; Length 20; 100.0%; Pred. This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositided-1*timase, regulatory subunit 4, p150. The phosphoinositided-1*timase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified sugar molety. The can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease condition associated with phosphoinositide-3-kinase, regulatory condition associated with phosphoinositide-13-kinase, regulatory cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; pl50; internucleoside linkage; phosphorothioate linkage; 2'.O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumnour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124638.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                 This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide. Stimase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, oligonucleotides comprises at least to comprises at least one modified sugar moiety, preferably a 2-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one moiffied uncleobase, preferably a 5-methylcytosine. The antisense oligonucleotide con be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-1-kinae, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used

This invention describes a novel antisense oligomucleotides which specifically hybridises to and inhibits the expression of human specifically hybridises to and inhibits the expression of human phosphoinositide 3-kinase, regulatory subunit 4, piso. The phosphoinositide of an international international international international preferably a phosphorothicate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The nucleobase, preferably a S-methylcytosine. The antisense oligonucleotide nucleobase, preferably a senesarch reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinostitide-3-kinase, regulatory subunit 4, piso, e.g. hyperproliferative disorder, preferably cancer, caubunit 4, piso, e.g. hyperproliferative disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyeteltyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chedlak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Indels

```

```
New antisense compound targeted to a nucleic acid molecule encodir
phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for
treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
  18-SEP-2003; 2003US-00667022.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                       This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, piso. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified augar molety, preferably a 2-0-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified antisense oligonucleotide further comprises at least one molified antisense oligonucleotide further comprises at least one molified on uncleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kite. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, piso, e.g. hyperproliferative disorder, preferably cancer, chediak Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; plS0; internucleoside linkage; phosphorothioace linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                              New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human probabolinositided. *Kinase, regulatory subunit 4, p150. The phosphoinositided. *Kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcycosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection.

Cinflammation or tumour formation. It can also be used to treat a disease condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperprofiferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human specifically hybridises to and inhibits the expression of human to phosphoinositide—3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage. Comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The nucleobase, preferably a S-methylycytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide—3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; pl50; internucleoside linkage; phosphorchinoste linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                      New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide 3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human specifically hybridises to and inhibits the expression of human phosphoinositide 3-kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least to me modified internucleoside linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The nucleobase, preferably a 5-methylycosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-1-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioace linkage; 2'-O-methoxystehyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Phosphoinositide-3-kinase regulatory subunit 4 p150 fragment 124595.
                                                                                                                                                                                                                                            compound targeted to a nucleic acid molecule encoding
                                                                                                                                                                                                                                                  New antisense compound targeted to a nucleic acid molecule encodir
phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for
treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠ
                                                                                                                                                                                                                                                                                                           This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, piso. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2-0-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease condition associated with phosphoinositide-3-kinase, regulatory subunit 4, piso, e.g. hyperproliferative disorder, preferably cancer, chediak Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human probabilities to and inhibits the expression of human to phosphoinositides. It mass, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide. *Atmase, regulatory subunit 4, p150. The phosphoinositide of unpurises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar molety, preferably a 2-0-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified undechase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kite. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. to prevent disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

phosphoinositide-3-kinase to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The modified gutther comprises at least one modified con thisense oligonucleotide further comprises at least one modified molechase, preferably a 5-methylyvosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also conclude prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperroliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used invention are immunomodulators with cytostatic activity and can be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioare linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide 3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.

antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one
                                                                                                                                                                                                                                                                                                                                                                                     antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.

modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified antisense oligonucleotide further comprises at least one modified can nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory cubunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3-kinase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioare linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound targeted to a nucleic acid molecule encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel antisense oligonuclectides which specifically hybridises to and inhibits the expression of human phosphoincatide-3-kinase, regulatory submit 4, p150. The oligonuclectides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified angere oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also
preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylyctosine. The antisense oligonucleotide can be used prophylateically a 5-methylyctosine. The antisense oligonucleotide be used prophylateically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide 3-kinase, regulatory subbunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorochioacte linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;

This invention describes a novel antisense oligonuclectides which specifically hybridises to and inhibits the expression of human phosphoinostitée-3-kinase, regulatory submit 4, p150. The oligonuclectides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2-0-methoxyethyl sugar moiety. The antisense oligonucleotide further comprises at least one modified antisense oligonucleotide further comprises at least one moiffied antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory submint 4, p150, e.g. hyperproliferative disorder, preferably cancer, Chediak-Higashi syndrome or a metabolic disorder. The products of the
                                                                                                                                                                                                                                          ö
              inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorothioace linkage; 2'-0-methoxysthyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphornositide. Stranse, regulatory subunit 4, piso. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory combunit 4, plso, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-1*timase, regulatory subunit 4, p150. The phosphoinositide-1*chase, regulatory subunit 4, p150. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified modified modety, preferably a 2'-O-methoxyethyl sugar modety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory subunit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used

The invention relates to a novel method for isolating molecules using a micro-channel. The molecules are isolated by introducing a mixed solution confirm molecules and set isolated by introducing a mixed solution confirm molecules differing in molecular weight into a micro flow path, to form a non turbulent flow, and providing physical action to the molecules by changing the flow state, thus causing confirmed behaviours among different solute molecules, where the different behaviour smables uneven distribution of specific kinds of molecules in the flow path, causing separation of the molecules. The converted with a micro flow path, having one or more curved portions, a substrate with a micro flow path, having one or more curved portions, a substrate with a micro flow path, having one or more curved portions, a substrate with a micro flow path, having one or more curved portions of side, and a physical property detection sensor arranged inside the curved portion or outside the curved portion. The method inside the curved conformation of side, and a fifticiant separation of molecules by utilising specific flow behaviour in a non turbulent flow, in a micro flow path, where a large number of samples can be processed. This polymucleotide sequence in minder of samples can be processed. This polymucleotide sequence
                                                                                                                                                                                                    molecule isolation; micro-channel; molecular weight; micro flow path; polymer compound; flow behaviour; non turbulent flow; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolating molecules e.g., DNA, by introducing solution with two traces molecules into micro flow path to form non turbulent flow, providing physical action to molecule causing difference in flow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Maeda H, Shimizu H, Miyazaki M, Nakamura H;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 20;

```
Nucleotide sequences encoding mycrene synthase, limonene synthase and pinear synthase from Grand fir may be incorporated into any organism pinear pinear plant, animal, microbe), or derived cell culture that pinear plant, animal, microbe), or derived cell culture that consumes any theory of the production of the aforementioned produces geranyl diphosphate for the production of the aforementioned carginary also be used for the production or modification of flavour and cargina properties, improvement of defense capability, and the alteration of their ecological interactions mediated by mycrene, limonene, pinene, or their derivatives. In particular they can be used for the production or of plant seeds for the extraction of oil or meal. Onlys encoding myrcene of plant seeds for the extraction of oil or meal. Onlys encoding myrcene synthase primers for the extraction of four degenerate primers (AxX08646 or ever identified for construction of four degenerate primers (AxX08646 or ever identified for construction of four degenerate primers (AxX08646 or ever identified for construction of four degenerate primers (AxX08646 or ever identified for construction of four degenerate primers (AxX08649 and AXX0864) and an antisense primer and used for CRAV08648 and AXX08649 generated a PCR product which was 110 base pairs in the amplified product was used in a plasmid construct to cranscruct account of the capability of product was used in a plasmid construct to synthase sequence given in AxX08643. The other clones is the myrcene of escribed in AxX0864-5.53) were identified for construction of three degenerated a pCR product was used in a plasmid construct to cranscrated a PCR product was used in a plasmid construct to conserved sequences were identified for construction of these clones is the conserved sequence was identical in all transformately 1020 base pairs in construct by the primers described in AxX08643. The other 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 21 BP; 5 A; 6 C; 7 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of monoterpene synthases from the grand fir. These include (-)-camphene synthase, (-)-beta-phellandrene synthase, terpinolene synthase, (-)-limonene/(-)-alpha-pinene synthase, limonene synthase, myrcene synthase and pinene synthase. The sequences can be used to produce transgenic plants expressing high levels of the enzymes, resulting in levels which are useful in protecting against and treating cancers, and to confer insect resistance on plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding monoterpene synthases, for increasing terpene synthesis in plants, e.g. for increasing resistance to pests or for treatment of cancer.

Riboflavin (vitamin B2) is an additive for human foods and animal fodder. The present sequence is a PCR primer used to isolate the Ashbya gossypii rib7 gene which was used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        virucide; gene therapy; hantavirus; M segment; L segment; S segment; hantavirus; hantavirus; hantavirus; hantavirus; hantaan virus; HNTV; DNA vaccine; HNTV M genomic segment; pWRG/HTN-M9(x);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Microbial production of riboflavin (vitamin B2), useful as additive for human food or animal fodder, comprises growth of microbes in which activity of rib gene products is increased.

                                                                                                                                         The invention describes a nucleic acid (1), or its fragment, comprising a fully defined sequence of 24 base pairs, as given in the specification. Also described are: a recombinant DNA construct comprising a vector, at least one hantavirus M gene nucleic acid fragment and the nucleic acid fragment (1); a composition (II) comprising inert particles and a nucleic acid coated onto the inert particles producing nucleic acid coated onto the inert particles producing nucleic acid coated onto the next particles producing nucleic acid coated onto in a hantavirus polynucleotide M segment encoding G1 and G2 from one or more hantavirus polynucleotide M segment encoding G1 and G2 from one or more hantavirus infection, comprising the composition (II) and a pharmaceutical excipient; inducing a protective immune response against hantavirus infection in a mammal; a vaccine against infection with the hantavirus infection in a mammal; a vaccine against infection with the detecting hantavirus infection; and a hantavirus infection with the composition (II); treating the composition (II); reating the detecting the composition (II) and ancillary reagents for detecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                           presence or absence of hantavirus antigens in a sample. The composition and methods are useful for diagnosing, preventing and treating hantavirus infection. This sequence represents an exogenous DNA associated with the Hantaan hantavirus DNA vaccine comprising the HNTV M (medium) genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MHC; major histocompatability complex; class II; control oligomers; DR A; transplantation; antigen; autoimmune disease; ss.

The sequences can be used in the treatment of lymphadenoma, cancer, dysgenopathy, phlogosis, immune diseases, haemopathy and HIV infection. The present
                                                                                                                                                                                                                                             The sequences given in AAQ47176-77 represent triplex forming oligonucleotides which bind to the mRNA sequence of the MHC class II locus DR A structural gene at positions 851-876. The sequences given in AAQ47178-80 represent control oligomers which contain base compositions similar to that around this DR A region but not containing the correct sequences. DR A is a transplantation antigen. Binding of this sequence to the DR A gene inhibits antigen production. This method may be used for treating individuals with autoimmune disease, characterised by dysfunctional expression of a transplantation antigen. It may also be used to produce cells which are more easily transplanted into a recipient. (Updated on 25-MAR-2003 to correct PN field.)
